Tutorial 01

Friday, March 14, 2008 (Time : 8³⁰ – 9¹⁵ Room : SR / T 1010)

1 Introduction to Mixed Variational Formulations: Examples

1.1 Scalar Elliptic BVP of the Second Order.

01 Formulate the mixed variational formulation of the mixed BVP

$$-\Delta u = f \text{ in } \Omega, \quad u = g \text{ on } \Gamma_1, \quad \frac{\partial u}{\partial n} = 0 \text{ on } \Gamma_2$$

for the Poisson-equation with given f , g , Γ_1 and Γ_2 , where $\Gamma_1 \cap \Gamma_2 = \emptyset$ and $\Gamma_1 \cup \Gamma_2 = \Gamma = \partial\Omega$!

1.2 The Stokes Equations

02 Let us consider a two-dimensional, steady state (stationary) flow of a highly viscous, incompressible fluid that can be described by the Stokes Equations

$$-\nu \Delta u + \nabla p = f \quad \text{in } \Omega, \tag{1.1}$$

$$\operatorname{div} u = 0 \quad \text{in } \Omega. \tag{1.2}$$

Assume that the velocity u can be represented by a so-called (scalar) stream-function ψ as

$$u = \operatorname{curl} \psi \tag{1.3}$$

with

$$\operatorname{curl} \psi = \begin{pmatrix} \frac{\partial \psi}{\partial x_2} \\ -\frac{\partial \psi}{\partial x_1} \end{pmatrix}$$

Show that

$$\operatorname{div} u = 0, \tag{1.4}$$

and derive the following relation from the equations (1.1):

$$\nu \Delta^2 \psi = \operatorname{curl} f \quad \text{in } \Omega, \tag{1.5}$$

where the so-called scalar curl is now defined by the relation

$$\operatorname{curl} f = \frac{\partial f_2}{\partial x_1} - \frac{\partial f_1}{\partial x_2}. \quad (1.6)$$

03 Which boundary conditions must be added to the biharmonic equation (1.5) such that the velocity $u = \mathbf{curl} \psi$ fulfils the no-slip boundary conditions $u = 0$ on the boundary $\Gamma = \partial\Omega$.

Hint: See Example 1.3 for possible boundary conditions for the biharmonic equation !
